Welcome to the 16-week course of levelOne. Even if you're not part of neogcamp you can still use this as a signpost to learn individual items listed.

opinions

This is an opinionated guide. I have spent 8+ years in this industry and worked in the ReactJS ecosystem. This guide favors React, favors hooks over classes (doesn't even mention classes), favors what I think is good to learn, and thus, is opinionated. It doesn't give you the choice.

I have made this entire course structure from three things:

1. Personal experience.
2. Opinions from thought leaders.
3. Feedback from startup CEOs who hire from ElevateLabs.

principles

Below are the principles, in order, used in making decisions while curating this roadmap.

1. Focus on building basics. Basics go long term. They don't change every year.
2. Less magic. When choosing between multiple frameworks, choose which does less so that you understand the basics more.
3. Understand why you're using something. More than the APIs concentrate on concepts. APIs can be looked up online.
4. Should be in the industry for the long term. Whatever is there from long will stay for long. New should be learned later.
5. Choose libraries or concepts which can be used across platforms.
6. Follow best practices from the beginning to build the right foundation.
7. Learn as little as possible. Learn to build full-stack apps. Don't try everything now.
8. Get ready for interviews. Interviews are a tad bit different than day to day programming, I can't change that, so accepting that and getting ready for it is part of the roadmap.
